PROJECT NAME

Project in Deep Learning for Natural Language Processing
(Group Semantic Seekers)

AFFILIATION(S)

Georg-August-Universität Göttingen

KEY APPLICATION(S)

The tasks the created contents were used for is: Paraphrase Detection on Quora Question Pairs. This AI usage cards refers to this part of the above mentioned project.

MODEL(S)

ChatGPT, GPT-5

DATE(S) USED

2026/08/25 –
2026/09/03

VERSION(S)

GPT-5.5 (with reasoning effort: High, reasoning effort: medium)

IDEATION

ChatGPT, GPT-5

GENERATING IDEAS, OUTLINES, AND WORKFLOWS

ChatGPT was used to discuss possible directions for improving the existing QQP paraphrase-detection baseline and to structure the experimental workflow. This included discussing sentence-pair interaction features, changes to the classification head, regularization, and the sequence in which the corresponding experiments could be evaluated.

FINDING GAPS OR COMPARE ASPECTS OF IDEAS

ChatGPT was used to critically compare proposed improvements and identify possible weaknesses in the experimental reasoning. For example, it was used to identify that changing the dropout rate and the maximum number of training epochs at the same time prevents attributing a performance difference exclusively to one of these changes.

IMPROVING EXISTING IDEAS

Text passages describing or summarizing project work were 'proof read' by ChatGPT and in case there were suggestion to improve coherent writing or argumentation, passages were adjusted, i.e. manually rewritten.

LITERATURE REVIEW

ChatGPT, GPT-3

FINDING LITERATURE

-

FINDING EXAMPLES FROM KNOWN LITERATURE

ChatGPT was used to locate examples from known work in which related sentence-pair representations are used. In particular, it helped relate the representation $[u, v, |u-v|, u \odot v]$ to approaches such as Sentence-BERT and InferSent.

ADDING ADDITIONAL LITERATURE FOR COMPARING LITERATURE

METHODOLOGY ChatGPT, GPT-5	EXISTING STATEMENTS AND FACTS ChatGPT was used to suggest literature supporting methodological statements that were already part of the project documentation, for example the use of absolute-difference and element-wise-product features for sentence-pair representations and the use of dropout as a regularization method.	ChatGPT was used to compare the implemented QQP approach with related work in order to distinguish which parts of the implementation were established techniques and which parts constituted our experimental adaptation of these techniques. This was especially used to avoid incorrectly presenting established sentence-pair features as a novel contribution.
	PROPOSING NEW SOLUTIONS TO PROBLEMS ChatGPT was used to discuss possible modifications of the provided QQP baseline.	FINDING ITERATIVE OPTIMIZATIONS ChatGPT was used to discuss follow-up experiments based on previous results. For example, after the MLP with a dropout rate of 0.3 did not improve over the linear pair-feature model, a lower dropout rate was discussed as a targeted follow-up. It was also used to discuss a longer training budget and early stopping after inspecting the behavior of the previous runs.
	COMPARING RELATED SOLUTIONS -	
EXPERIMENTS ChatGPT, GPT-5	DESIGNING NEW EXPERIMENTS ChatGPT was used to assist in defining experiment configurations for the QQP improvements. This included smoke tests, full training runs, comparisons between a linear head and an MLP head, and a subsequent run using lower dropout and a larger maximum epoch budget.	EDITING EXISTING EXPERIMENTS ChatGPT was used to revise existing Slurm scripts and command-line configurations, for example to change epoch counts, dropout values, early-stopping parameters, output paths, and experiment naming. The resulting scripts were manually inspected and the experiments were executed by the project author on the HPC cluster.
	FINDING, COMPARING, AND AGGREGATING RESULTS -	
WRITING ChatGPT, GPT-5	GENERATING NEW TEXT BASED ON INSTRUCTIONS Drafts were created	ASSISTING IN IMPROVING OWN CONTENT Texts were discussed with ChatGPT in order to obtain feedback.
	PARAPHRASING RELATED WORK -	PUTTING OTHER WORKS IN PERSPECTIVE -
PRESENTATION ChatGPT, GPT-5	GENERATING NEW ARTIFACTS AI was used to create code that generates the graphs contained in the respective	IMPROVING THE AESTHETICS OF ARTIFACTS -

readme part.

FINDING RELATIONS BETWEEN OWN OR RELATED ARTIFACTS

-

CODING

ChatGPT, GPT-5

GENERATING NEW CODE BASED ON DESCRIPTIONS OR EXISTING CODE

AI usage in to create fragments of python and shell scripts.

COMPARING ASPECTS OF EXISTING CODE

-

REFACTORING AND OPTIMIZING EXISTING CODE

ChatGPT was consulted when code was not running as expected.

DATA

ChatGPT, GPT-5

SUGGESTING NEW SOURCES FOR DATA COLLECTION

-

FINDING RELATIONS BETWEEN DATA AND COLLECTION METHODS

-

CLEANING, NORMALIZING, OR STANDARDIZING DATA

-

ETHICS

ChatGPT, GPT-5

WHAT ARE THE IMPLICATIONS OF USING AI FOR THIS PROJECT?

We need to be responsible and assure we submit a project we understand conceptually as a team and all the work on tasks has to be understood by their contributor more in depth.

WHAT STEPS ARE WE TAKING TO MINIMIZE THE CHANCE OF HARM OR INAPPROPRIATE USE OF AI FOR THIS PROJECT?

Since this project is a task that serves as exercise and examination, that especially in the current stage and generally is neither thought to be published nor to be applied on real world data, we do not consider necessary any steps to protect any individual that might be connected to the training data. Furthermore, we believe that this AI Usage Card provides a means to clarify what is genuine contribution, what is AI content and what is hybrid.

WHAT STEPS ARE WE TAKING TO MITIGATE ERRORS OF AI FOR THIS PROJECT?

We carefully revise any content that involved using AI. Further, all contents, despite if AI was used to create them or not, were revised by at least one team member.

THE CORRESPONDING AUTHORS VERIFY AND AGREE WITH THE MODIFICATIONS OR GENERATIONS OF THEIR USED AI-GENERATED CONTENT

All contents created or altered by AI were supervised and found to be acceptable by all group members.
